

Erosion control

Choose from proven solutions able to support projects of any size and scope

Vereco offers a diverse range of erosion control solutions, including those that convert into permanent vegetation once established. We also deeply understand the demands of project delivery and site operations and know how to ensure our work effectively supports program and budget targets.

Contexts

Our team works with numerous proven, effective erosion control solutions that span the full gamut of temporary and permanent erosion control requirements. Clients gain the environmental outcomes they need while achieving a result that is sensitive to their commercial and technical boundaries.

When delivered with the full picture of a project's objectives in mind, some of these solutions can be extended to provide additional environmental benefits such as sediment and dust control through to long-term vegetation.

Method

Our team's experience across numerous sectors and site contexts enables us to provide precise recommendations on the options best able to meet your needs. We start by understanding your site context, specifications and project goals to ensure a fit-for-purpose solution.

Our team is then able to deploy a vast range of erosion control systems including natural and synthetic fibre mats and blankets, silt fences, soil binders and synthetic polymers, stockpile and ditch liners, rock mattresses and gabions. The chosen solution is tailored to suit site conditions such as slope severity and expected water-flow velocity alongside other requirements. Many can be finished with a revegetation solution.

The right upfront thinking and planning can leverage erosion control solutions to deliver the added cost, time and environmental benefits of revegetation

Benefits

- Diverse options via one provider
- End-to-end support from supply to installation
- Full compliance to specifications
- Experience with strict site requirements
- Environmental expertise
- Competitive pricing
- Rapid delivery following preparation work
- Immediate erosion control results
- Added gains such as sediment and dust control
- Integrated solutions including revegetation

The right application of erosion control solutions can deliver immediate results over a large-scale site

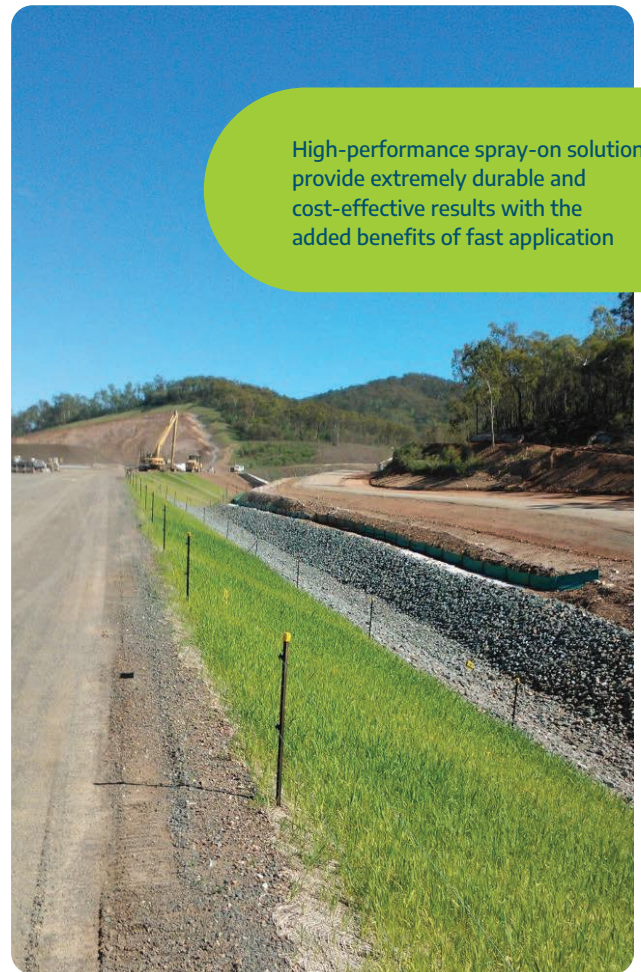

Steps for success

Our service covers advice, supply, delivery and application, timed to closely follow preliminary work. The sooner we are engaged, the better we can understand your program and requirements to close the gap as much as practical between ground exposure and erosion control installation.

As we also offer soil amelioration and revegetation services, we can combine these to deliver greater project value in one step. Importantly, we are not a biased contractor. We use a range of products and suppliers and evaluate the benefits of relevant options per project. This gives you the assurance of independent advice on the best solution for your site, project objectives, program and budget.

Our team is able to deploy a vast range of erosion control systems, tailored to suit site conditions

The size and skill of our team and fleet mean we can deliver large-scale work across Queensland and into the Northern Territory under strict compliance and specification regimes. For clients requiring a rolling program, we work closely with your site teams to ensure flexibility and speed in delivery.

High-performance spray-on solutions provide extremely durable and cost-effective results with the added benefits of fast application

Contact us today for a tailored solution

From tender pricing to live project support, our team welcomes the opportunity to work with you to ensure you gain the right solution. This includes providing advice on additional complementary services such as simple cover crop application through to designed revegetation schemes. Contact us today for more information.
